The cold water...X-Section

Selection not optimal for high energy resonances?

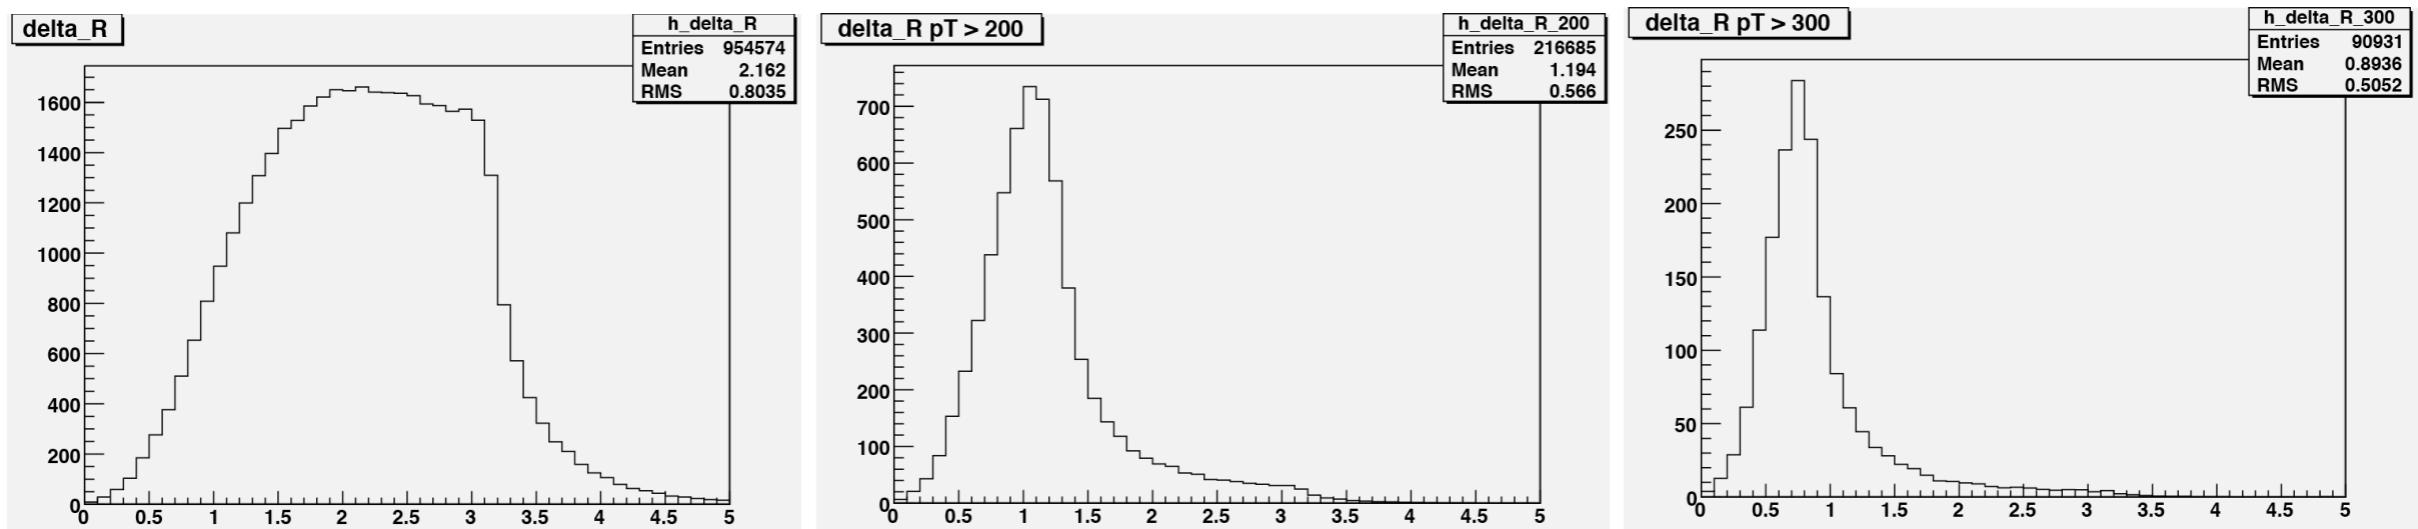

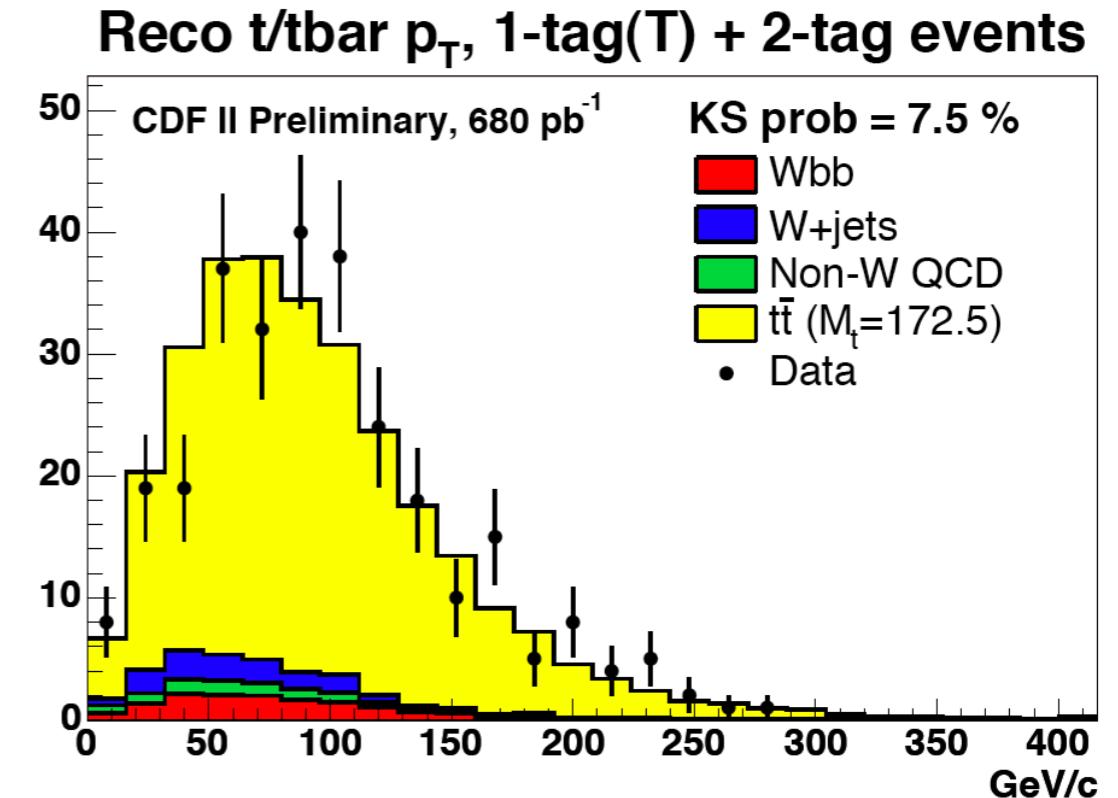

Color Octet $M_x = 700$ GeV

Boosted Top at the Tevatron

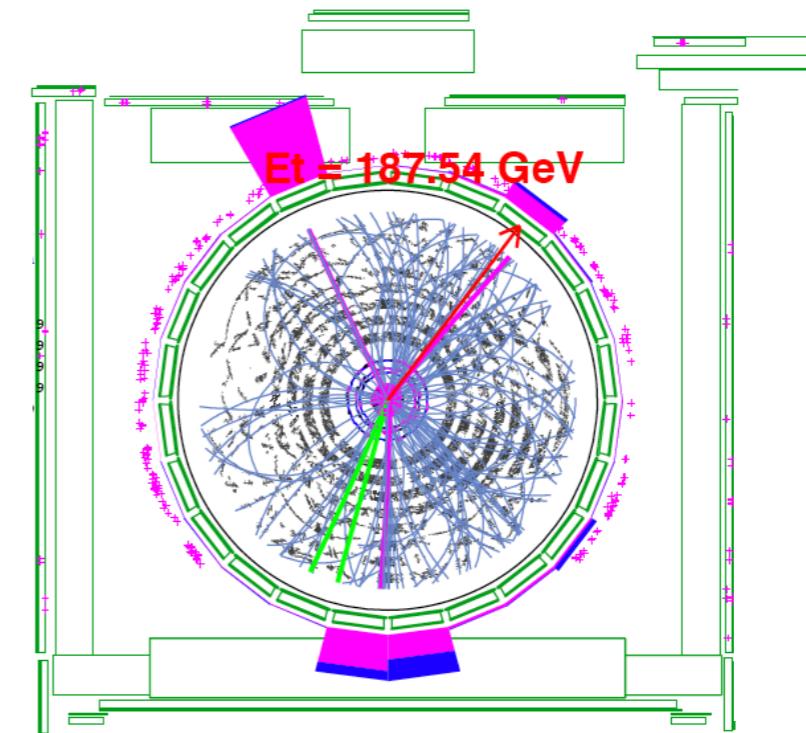

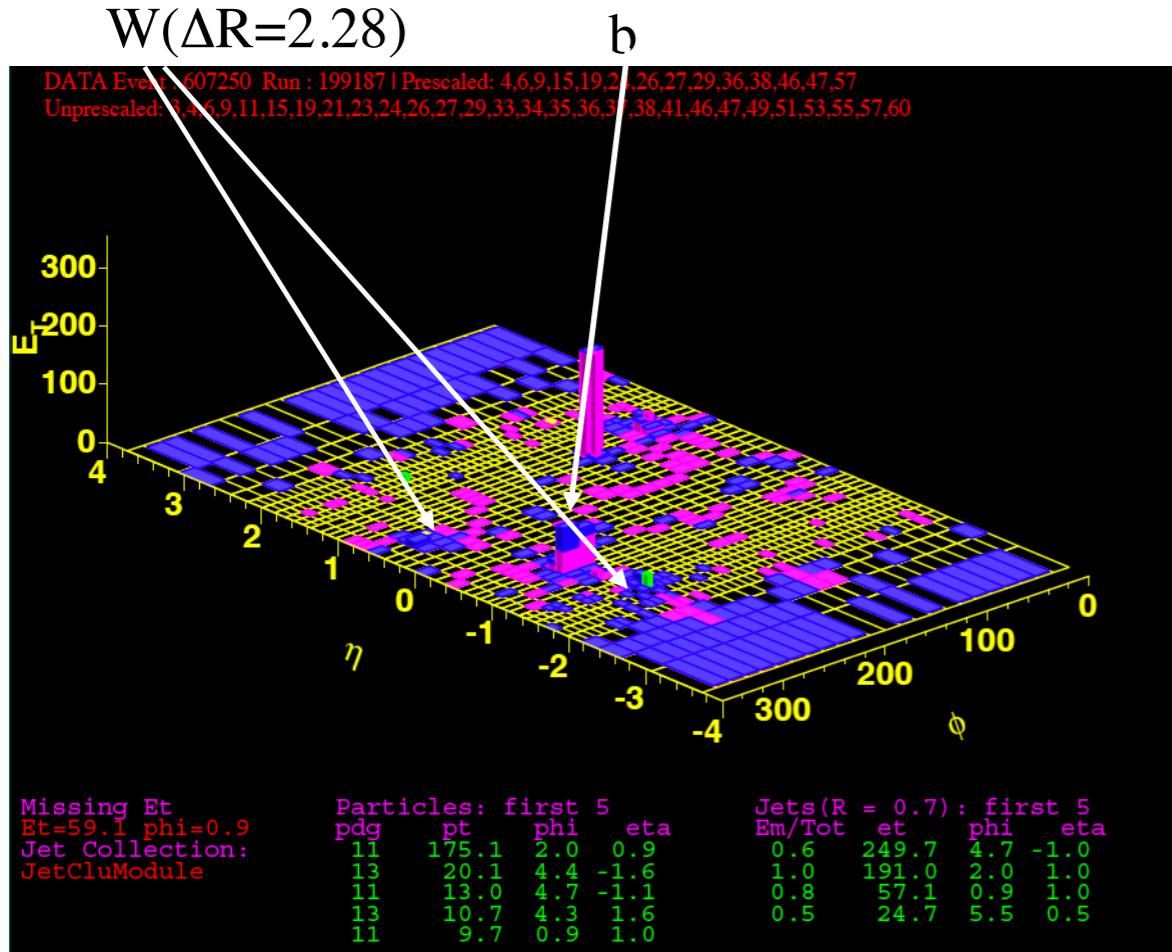

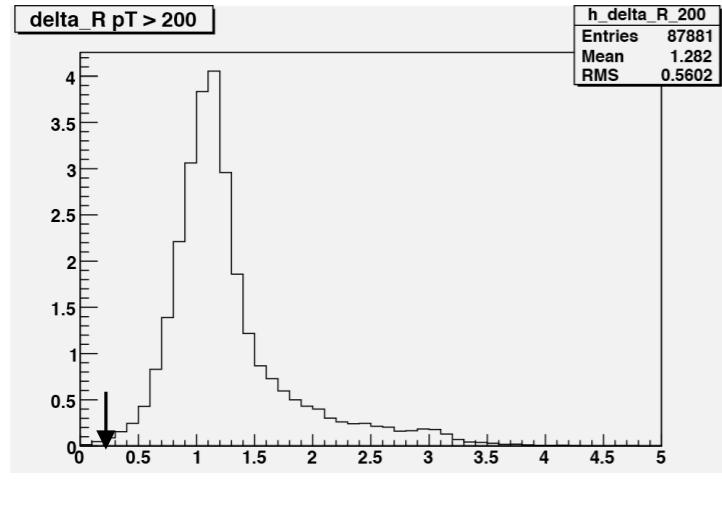

- Can we do this?
- Could be cutting off our tails
 - Delta R cuts on jets
 - Isolation on lepton
- If t' and A_{fb} are hinting at something, this might be a good direction

But what else?

- Joey Huston (MSU)

$p_T=270 \text{ GeV}/c$

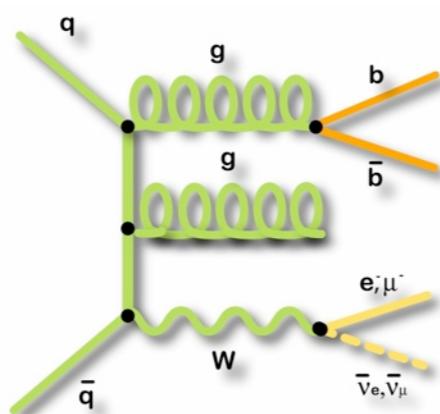

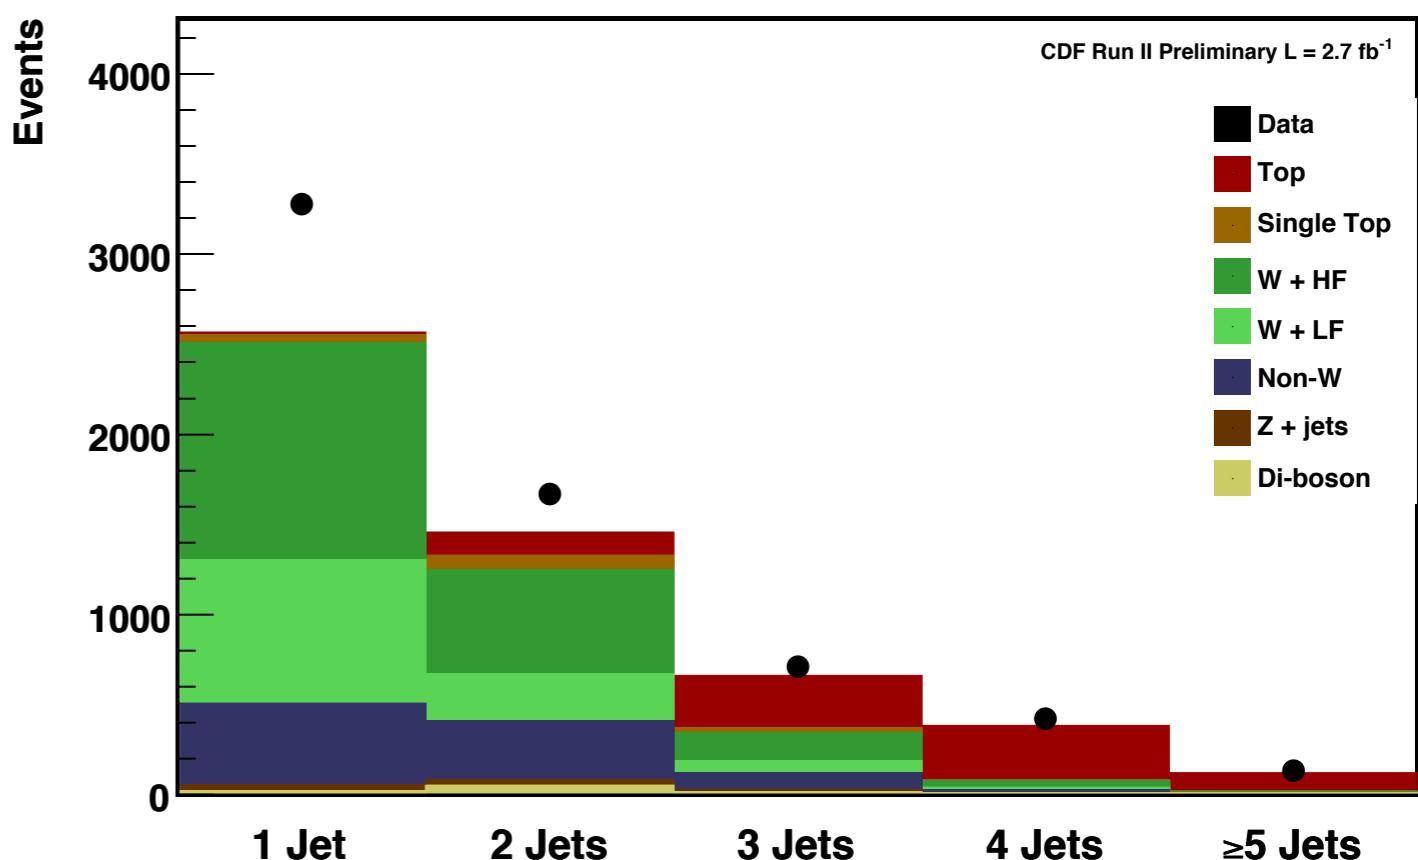

- Joey Huston (MSU)

**Do we understand
backgrounds or are they just
contained?**

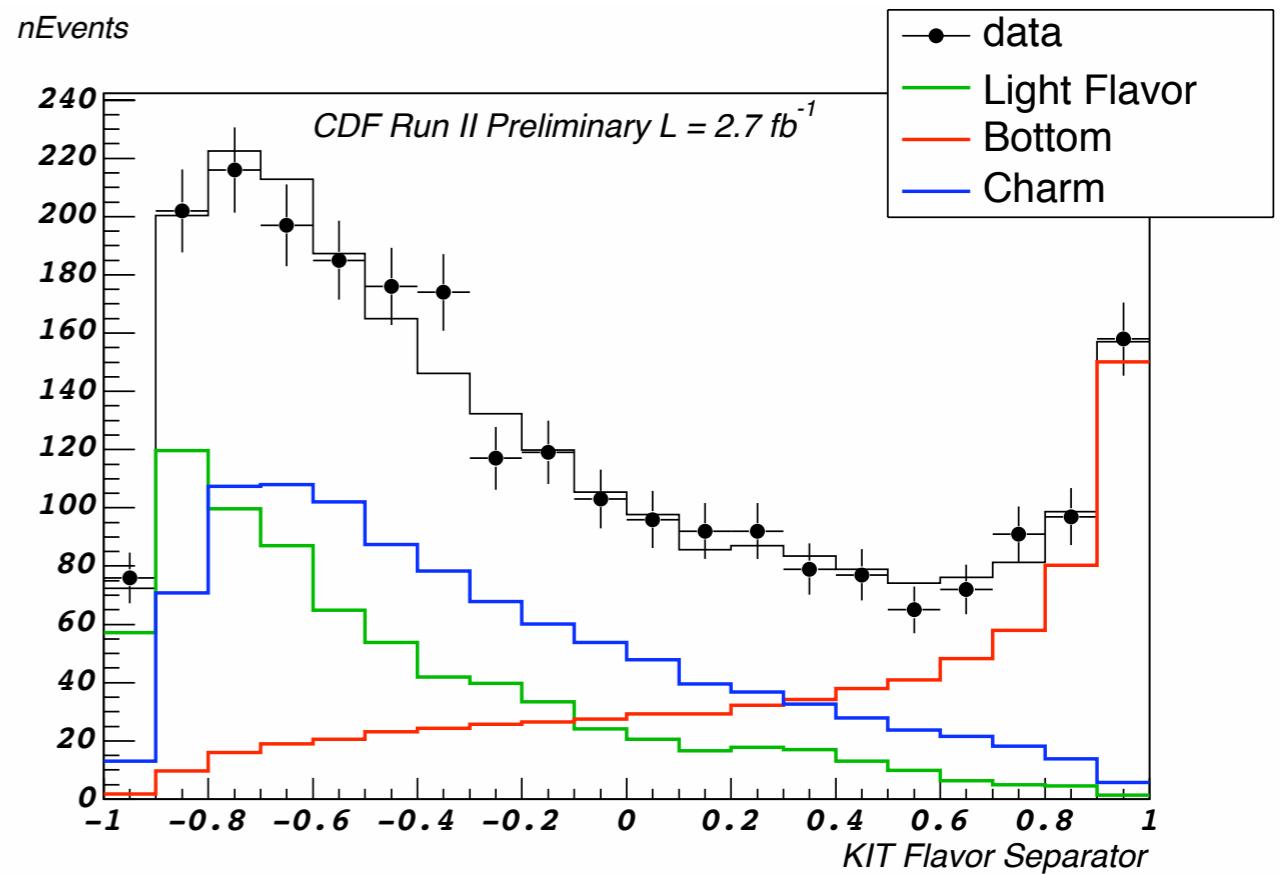

Tagging Prediction

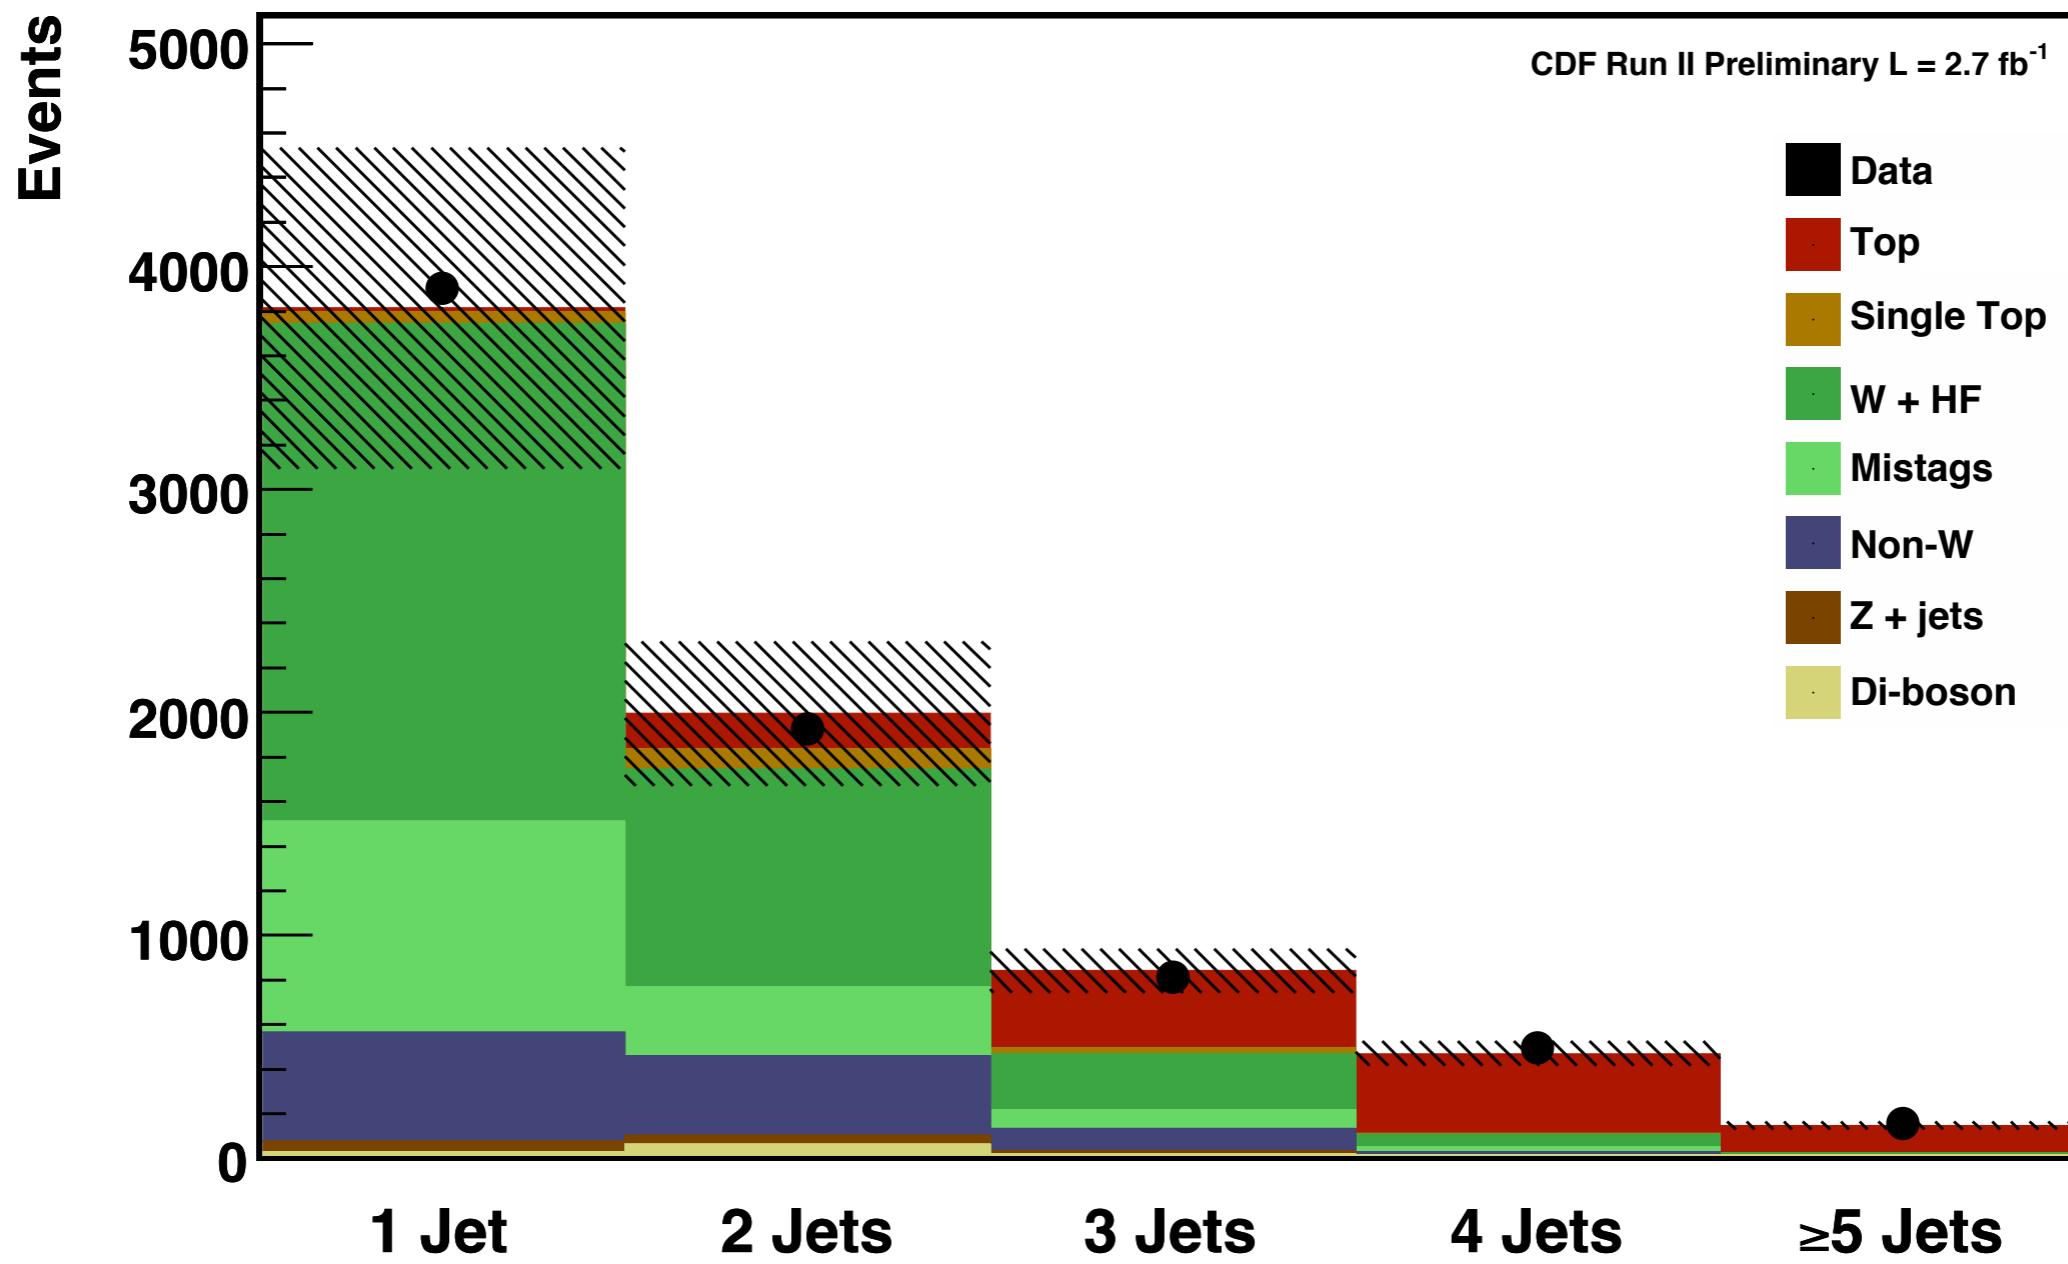

- Background dominated regions look awful!
- So what's wrong?
- Turns out that LO Monte Carlo under predicts the amount of W+jet events with heavy flavor

Correcting W + HF

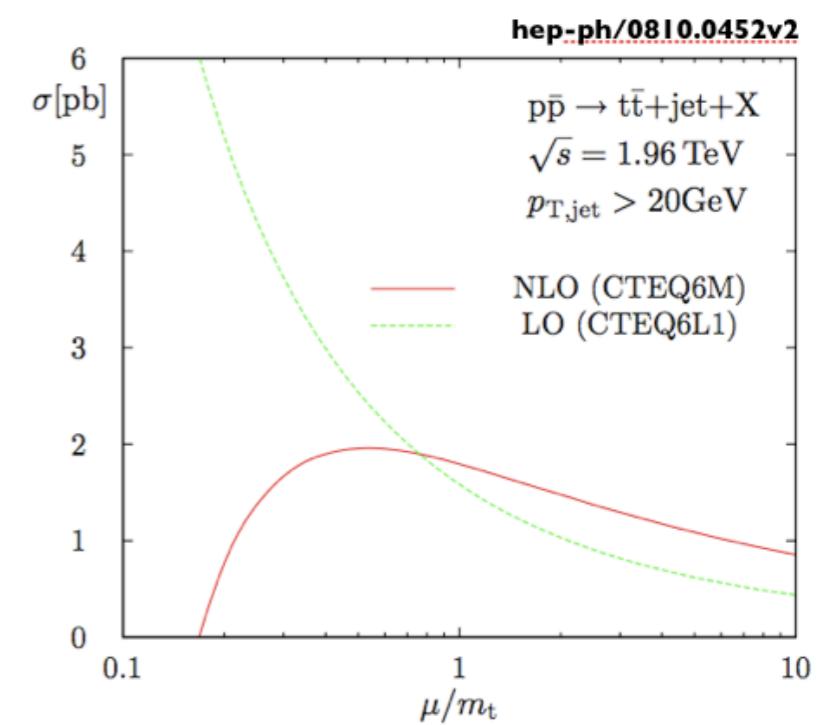

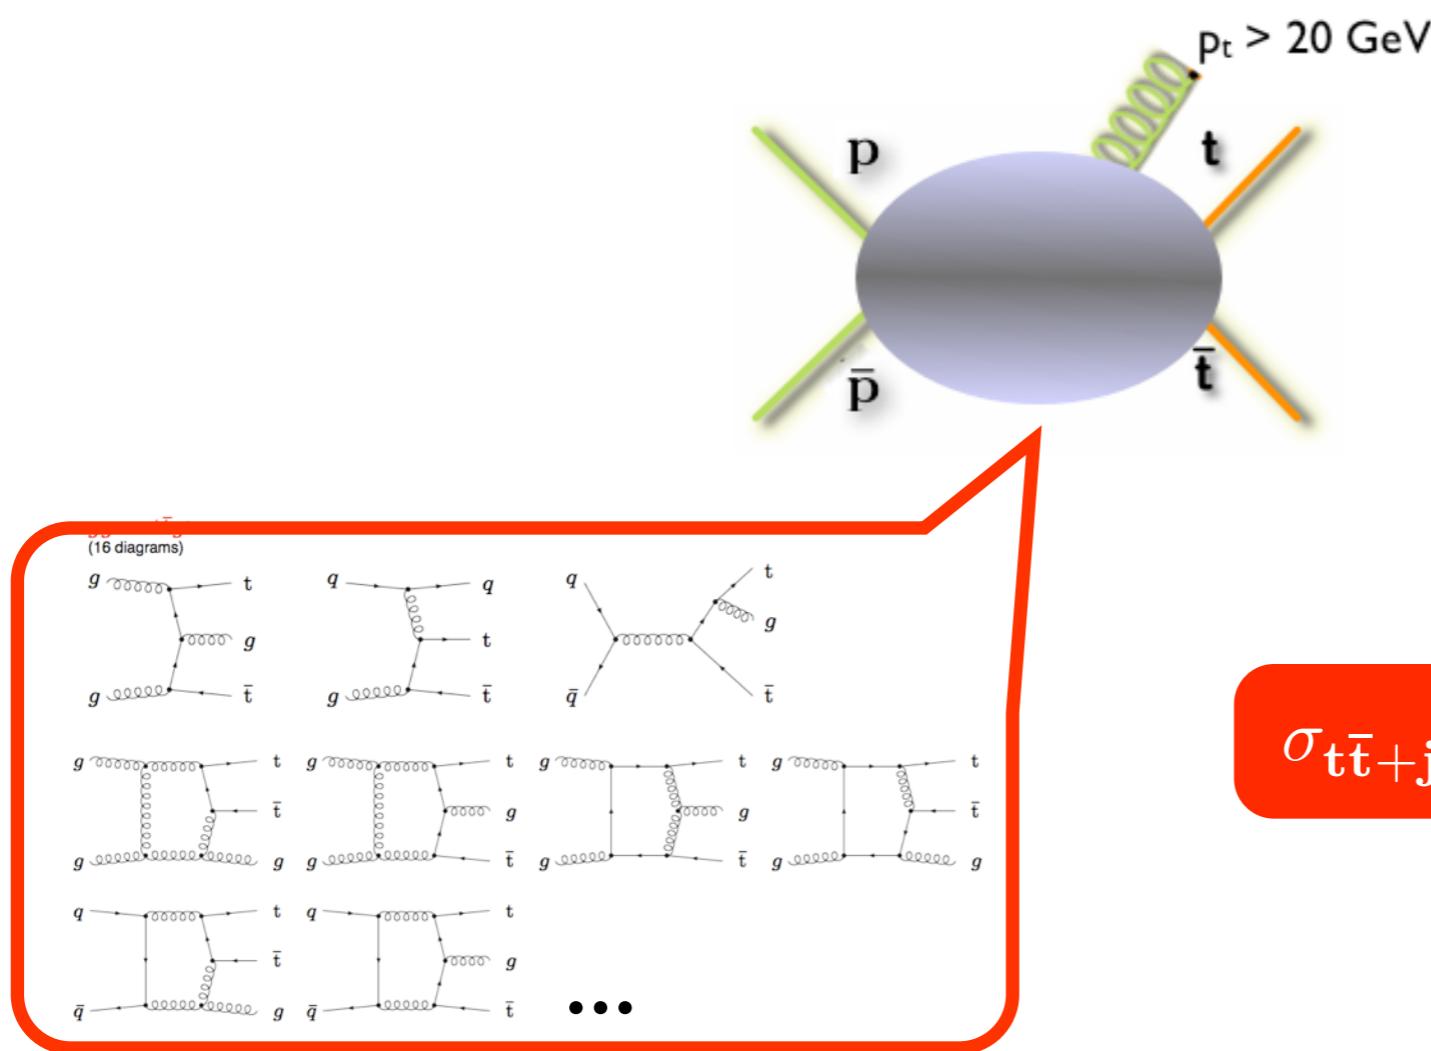

- Effectively we measure the Heavy Flavor content in W+I jet events
- Use a Neural Network trained on tracking/tag variables to distinguish bottom, charm and light flavor
- Simultaneously fit for bottom, charm, and light flavor fractions
- Compare to Monte Carlo to derive a correction factor and apply this to the W + jets prediction in the signal region
- Cross check technique across jet multiplicity

Measurement of the $t\bar{t} + j$ Cross Section

- Idea is to quantify the production of top anti-top pairs in association with a hard jet

$$\sigma_{t\bar{t}+j} = 1.6 \pm 0.2_{\text{stat}} \pm 0.5_{\text{syst}} \text{ pb}$$

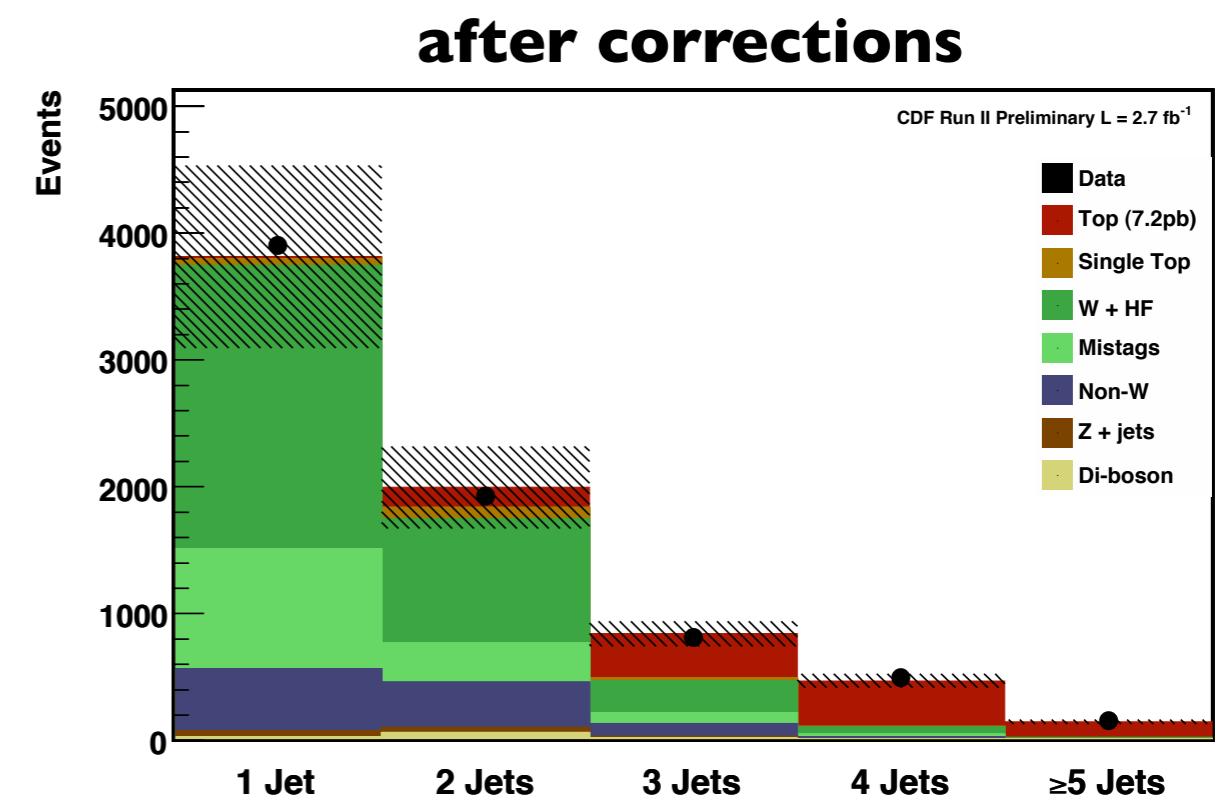

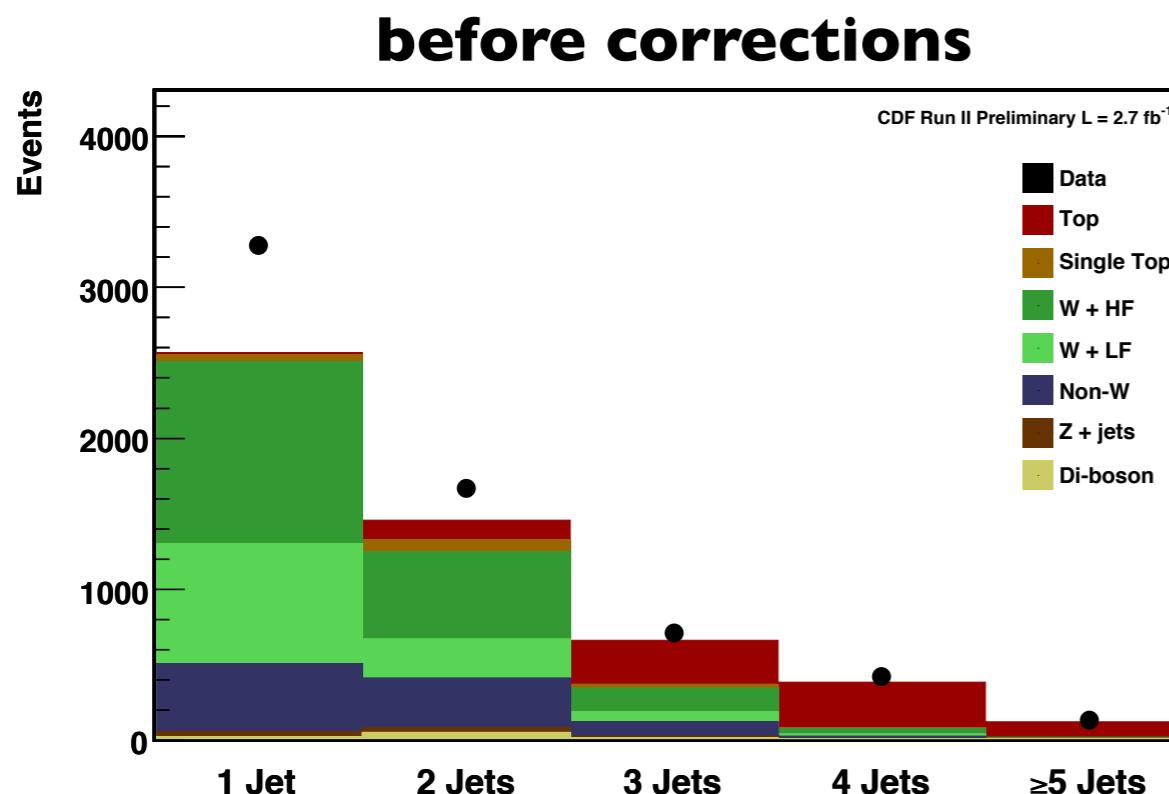

$$\sigma_{t\bar{t}+j} = 1.79^{+0.16}_{-0.31}$$

Dittmaier, Uwer, and Weinzierl [hep-ph/0810.0452v2](#)

Why should we care?

- Today's signal is tomorrow's background $H + 2 \text{ jets } t\bar{t}H$
- $t\bar{t}+j$ is to the LHC what $W + \text{heavy flavor}$ is to the Tevatron

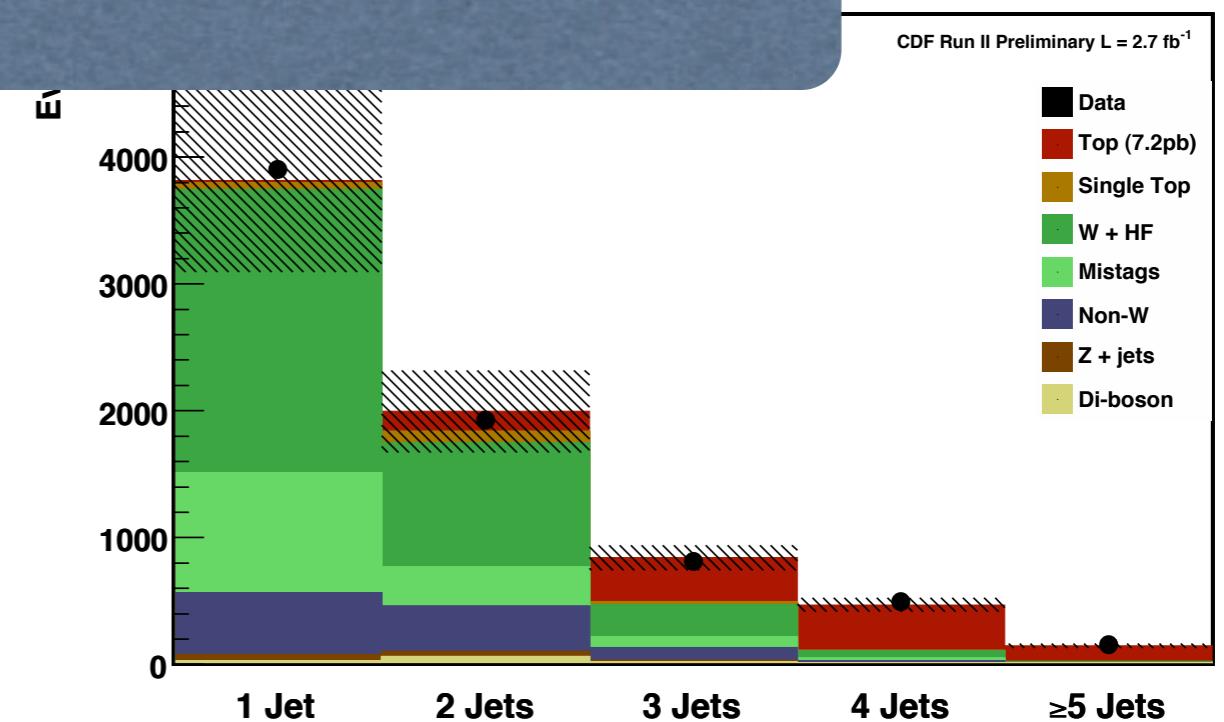

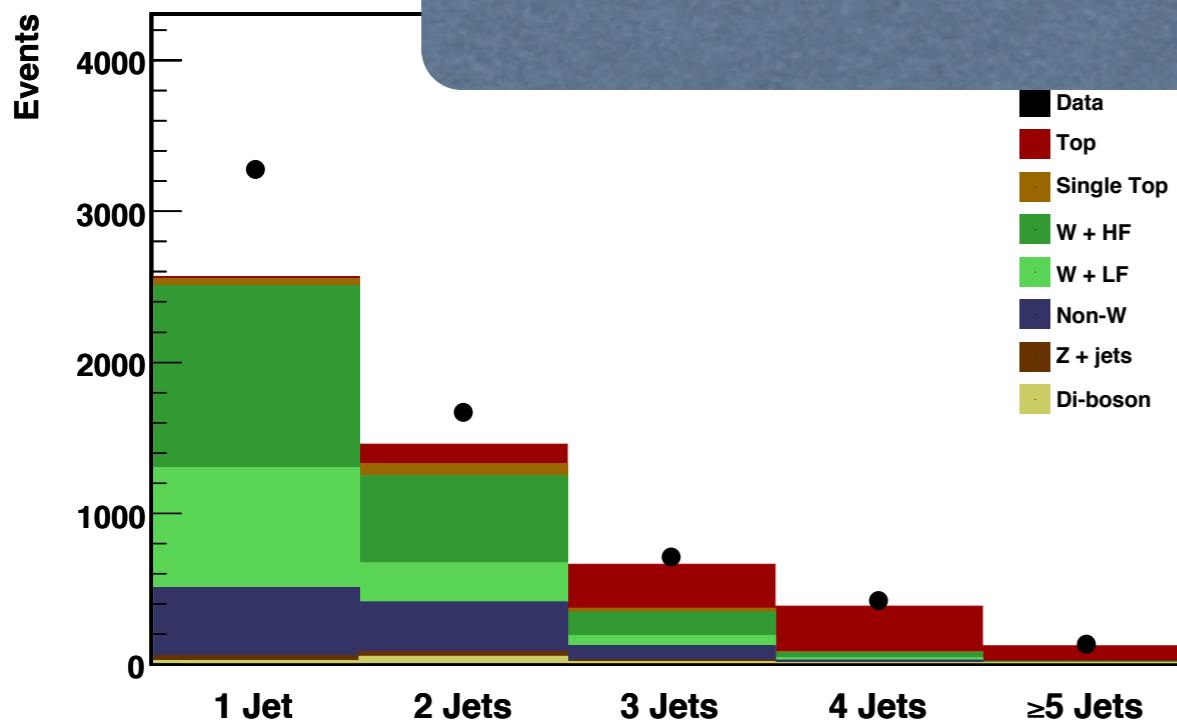

The W+HF problem

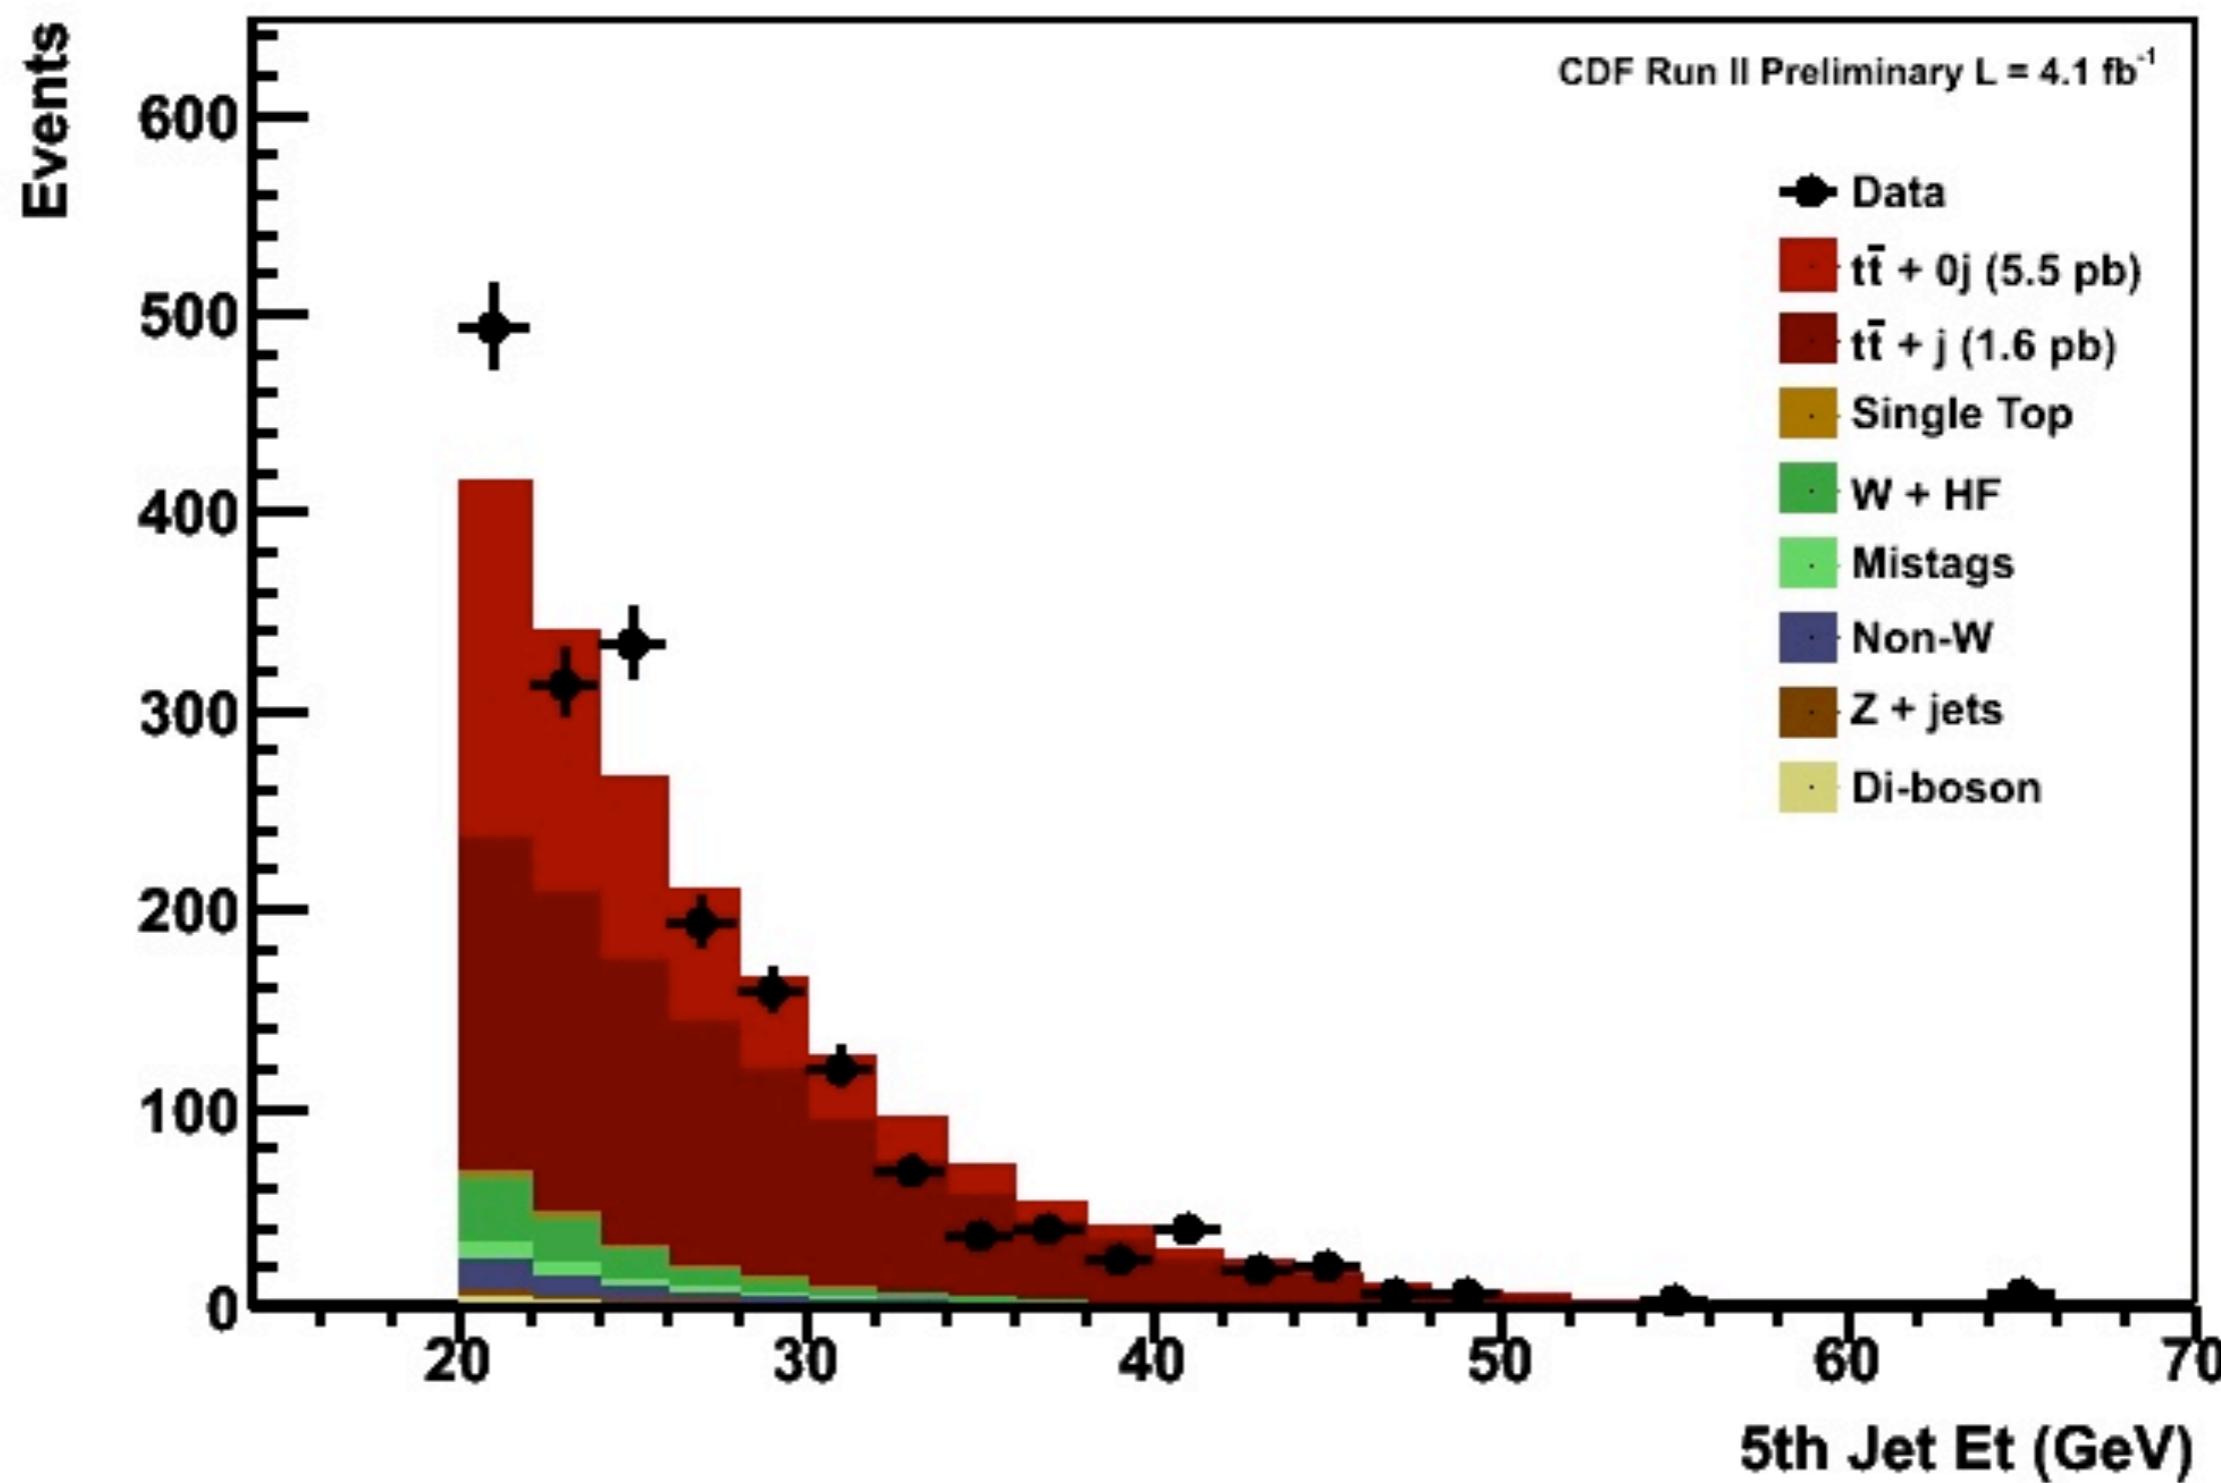

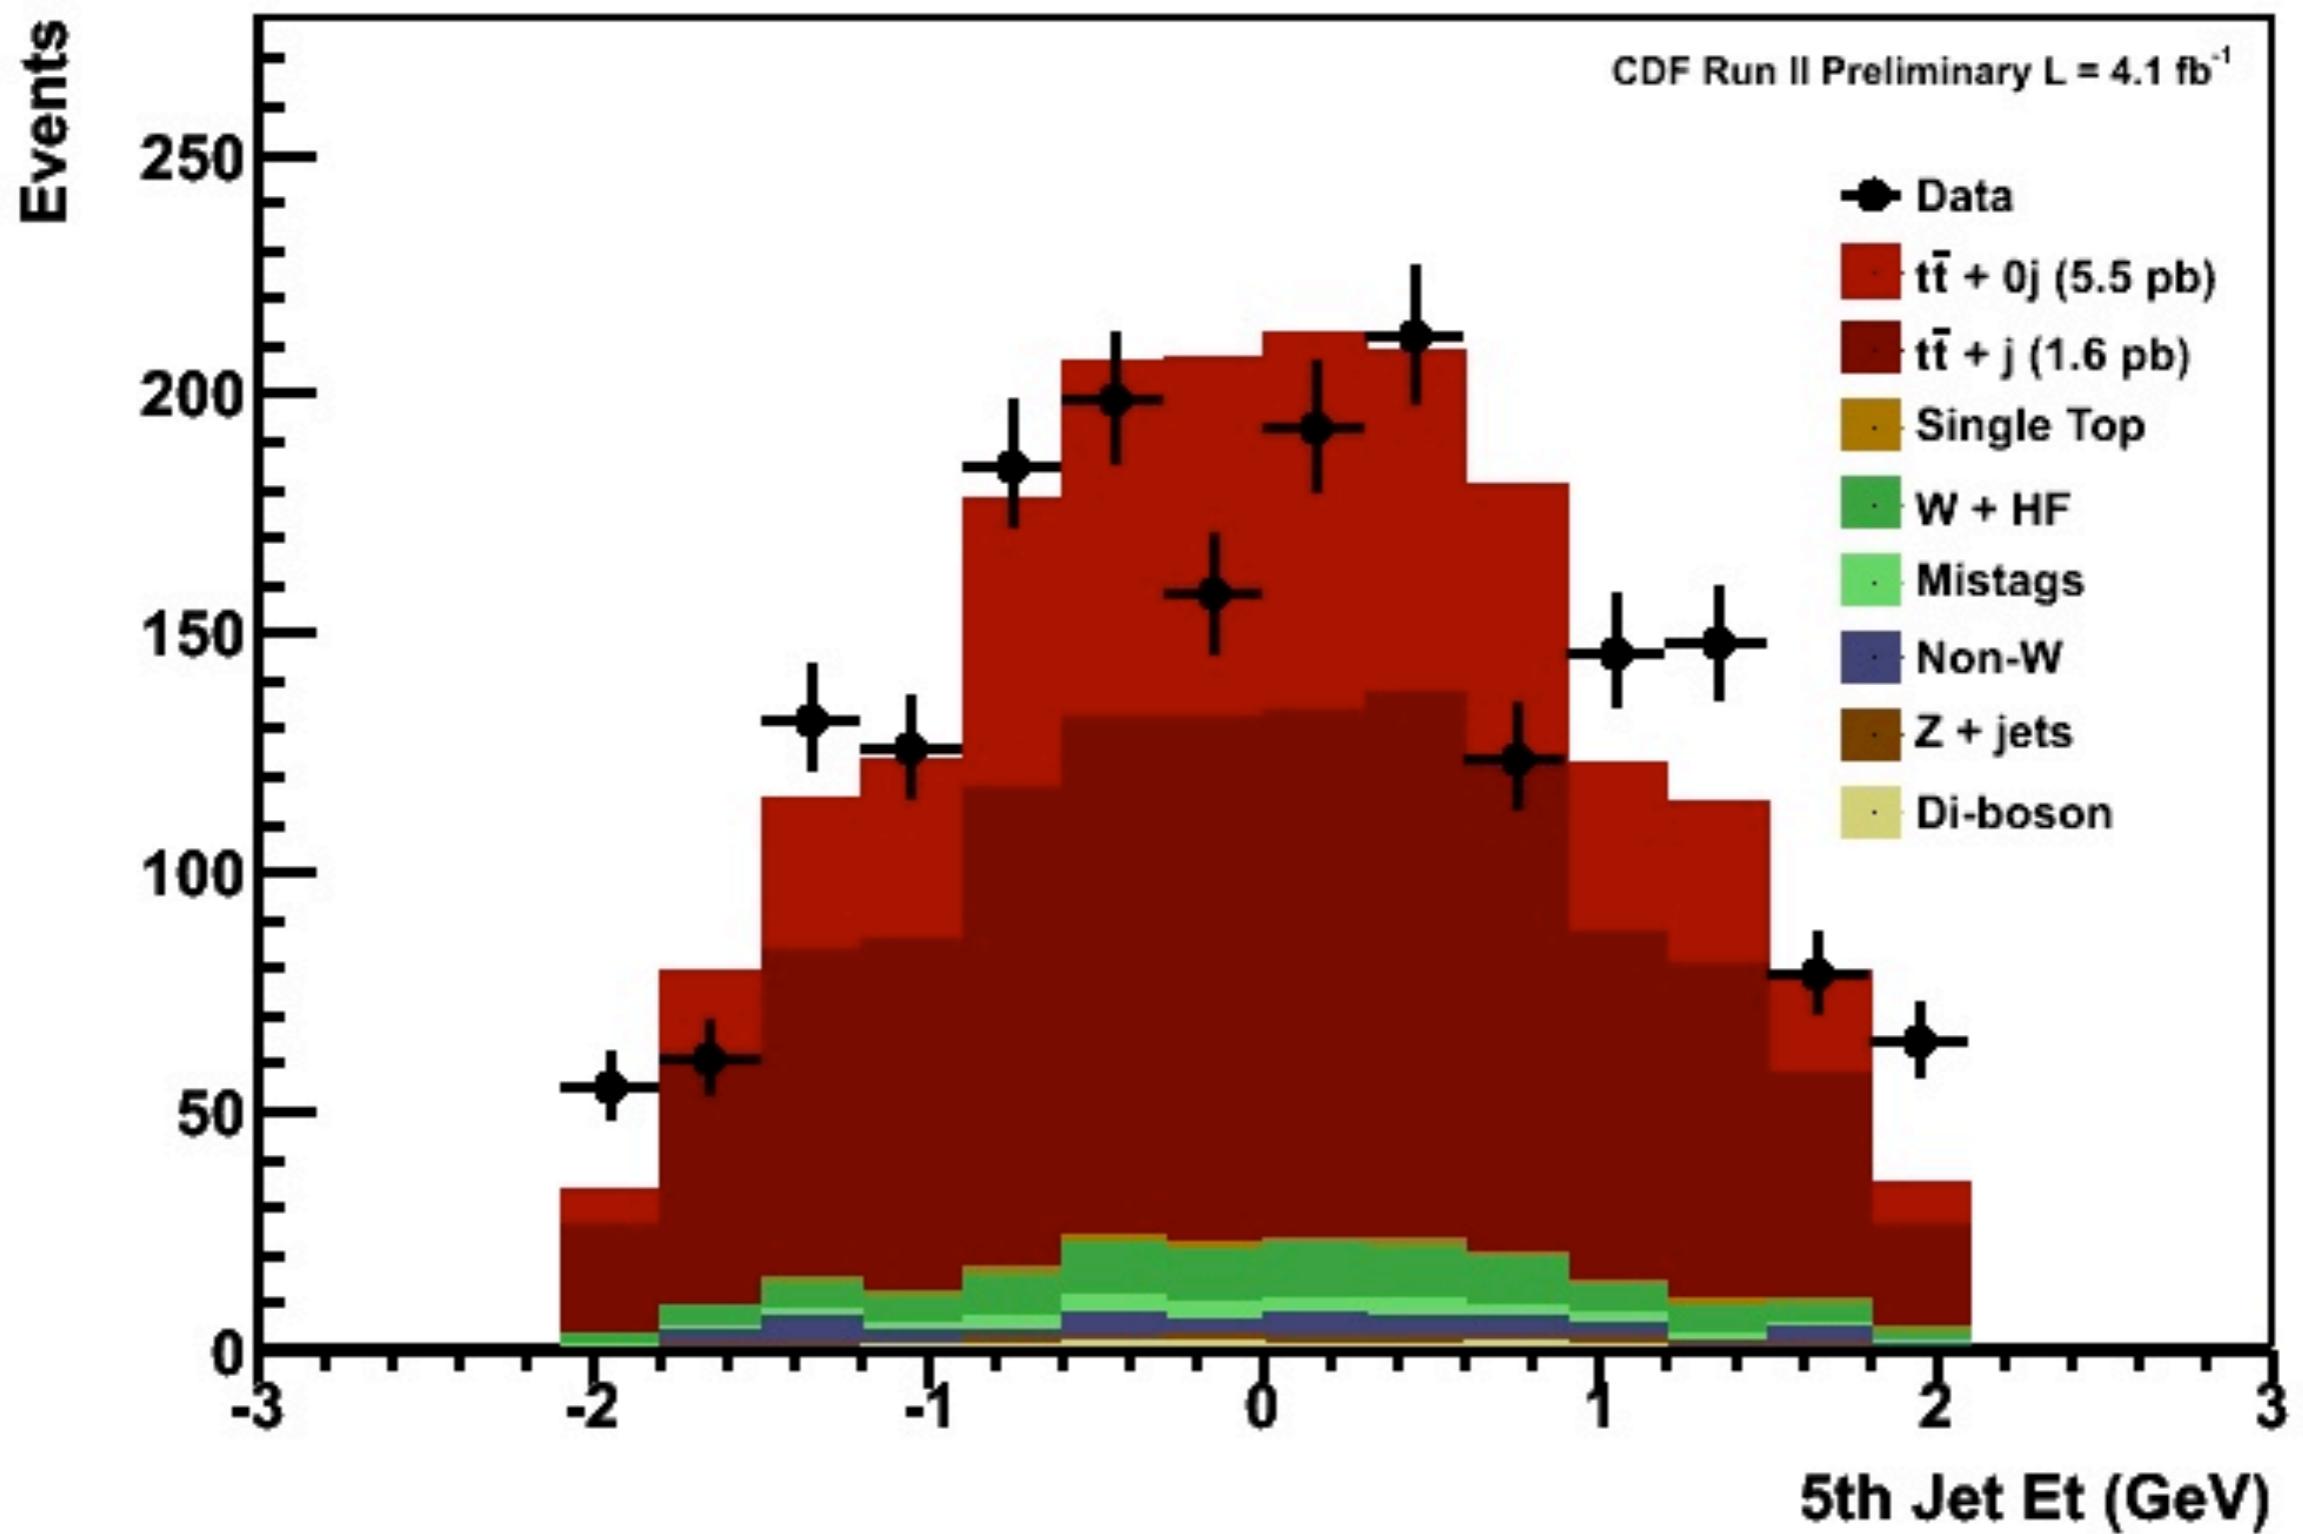

Why should we care?

- Today's signal is tomorrow's background $H + 2 \text{ jets } t\bar{t}H$
- $t\bar{t}+j$ is to the LHC what $W + \text{heavy flavor}$ is to the Tevatron

What will this look like at the LHC?
